Amendments to the Specification

Please replace the paragraph indicated below in its entirety with the replacement text as marked up.

Specification, page 20, lines 1-9:

Fig. 7 shows in greater detail the processing of a copy/paste command by the source editor. The user interactively selects one or more source statements to be copied (block 701). If the Unverified_Copy_Warn_Enable bit ~~222~~ 221 is set, the 'Y' branch is taken from block 703. In this case, the source editor checks the verification status of all copied statements. If all statements are either "Verified" or "Copy/Verified", the 'Y' branch is taken from block 703. Otherwise, the 'N' branch is taken, and the source editor displays a suitable warning message to the user, to the effect that the user is attempting to copy source statements which have not been verified (block 704). The source editor then increments the copy ID; this incremented value will be used to identify multiple copies created in the same copy operation.
